Introduction

Lamu County has a population of just over 101,000 people. About two in five (41%) people are aged below 15, 15% are aged under 5 and 22% are aged 10-19. A woman in Lamu County can expect to have 4 children in her lifetime, which is also referred to as the total fertility rate. Lamu County’s total fertility rate (4.2) is about the same as the national rate of 3.9 and also means that Lamu County has a high birth rate. The adolescent birth rate is slightly lower than the national rate but still about 1 in every 10 babies is born to an adolescent girl aged 15-19.

Lamu County is one of 15 Counties that account for over 60% of maternal deaths in Kenya. The latest estimate of the County’s maternal mortality ratio (MMR) is 676 deaths per 100,000 live births. Child death rates in Lamu County mirror the national trend but are higher. High maternal and child death rates are linked to high birth rates and limited access to life saving maternal and child health interventions.

This fact sheet highlights the status of key reproductive, maternal and child health interventions in Lamu County, in relation to the national status. The data are drawn from the 2009 and 2014 Kenya Demographic and Health Survey, the Kenya AIDS Indicator Survey (KAIS, 2007), the UN and other national and global studies.

Policy and legal context

Kenya has favourable policy and legal frameworks that promote reproductive, maternal, child and adolescent health and rights. These frameworks include the Constitution (2010), Kenya Health Policy (2014-2030), Kenya RMNCAH Investment Framework (2016), the National Reproductive Health policy (2007), and the Adolescent Sexual and Reproductive Health policy (2015).

Maternal health

Contraceptive use and unmet need

Use of contraceptives for prevention of unintended pregnancies averts 30% of maternal deaths and improves child survival. About two in five, (40%) of currently married
women aged 15-49 in Lamu County use a modern contraceptive method compared to the national rate of 53% (Figure 1). Unmet need for contraceptives refers to the proportion of women who would like to avoid pregnancy but are not using a modern contraceptive method. About one in five (19%) of currently married women aged 15-49 in Lamu County have an unmet need for contraceptives, which is about the same as the national rate of 17%.

**Figure 1. Modern CPR and unmet need for contraceptives, currently married women ages 15-49 (%)**

---

**Number of antenatal care visits**

Antenatal care is helpful in identifying adverse pregnancy outcomes, when it is sought early in the pregnancy and is continued until delivery. The World Health Organization recommends that women should have at least 4 antenatal care visits during each pregnancy. County data on antenatal care is not available. In Coast region, where Lamu County is located, 62% of women of reproductive age receive antenatal care at least 4 times during pregnancy, which is slightly higher than the national rate of 58% (Figure 2).

**Figure 2. Percentage of pregnant women ages 15-49 by number of ANC visits**

---

**Place of delivery**

Birth-related complications are reduced when women give birth in a health facility. In Lamu County, only 44% of births are delivered in a health facility compared to the national rate of 61%.

**Assistance by a skilled provider during delivery**

Obstetric care from a health professional during delivery is critical in reducing maternal and neonatal mortality. In Lamu County, about half (47%) of births are delivered by a skilled birth attendant compared to 62% at the national level (Figure 3).

---

**Prevention of mother-to-child transmission (PMTCT)**

PMTCT is an intervention aimed at preventing the transmission of HIV from mother to child and is an important intervention towards efforts to eliminate new HIV infections. The PMTCT initiative provides drugs, counselling and psychological support to help mothers safeguard their infants against the virus. Without any intervention, the risk of transmission of infection from the mother to the baby is 20-45%. PMTCT can reduce HIV transmission to less than 2%.

County and regional data on PMTCT coverage is not available. At national level, 74% of pregnant women living with HIV are receiving the most effective antiretroviral medicines for PMTCT. There is need to improve PMTCT coverage given that Kenya is among the top 20 high HIV burden countries in the world and contributes 5% of children aged 0-14 living with HIV and 5% of new HIV infections among children aged 0-14.
The HIV prevalence rate in Coast region, where Lamu County is located, is low (4.3%) relative to the national rate of 5.6%. Although, urban parts of the region (5.6%) and women (6.1%) have disproportionately higher prevalence rates relative to rural areas (3%) and men (2.6%).

**Abortion rates**
Unsafe abortion is one of the main causes of maternal deaths. A national study conducted in 2012, estimated that the induced abortion rate per 1000 women of reproductive age (15-49 years) and the Induced Abortion Ratio per 100 live births in Kenya is 48 and 30, respectively (Table 2). The abortion statistics for Coast region, where Lamu County is located, was merged with that for North Eastern region. The combined estimated induced abortion rate and ratio for the two regions are 51 and 32, respectively, which are about the same as the national induced abortion rate and ratio. The study found that 86% of women who presented to the health facility for post-abortal care were suffering from complications of unsafe abortion. The study found that 86% of women who presented to the health facility for post-abortal care were suffering from complications of unsafe abortion.

**Child health**

**Child immunisation**
Universal immunisation of children against six common vaccine-preventable diseases (tuberculosis, diphtheria, whooping cough (pertussis), tetanus, polio, and measles), is crucial to reducing infant and child mortality. The vaccination coverage in Lamu County is not universal and generally lower than the national coverage, except for polio where the vaccination coverage is higher (Figure 4).

**Figure 4. Percentage of children ages 12-23 months receiving specific vaccines**

Nutrition status for children under five years
Adequate nutrition is critical to children’s growth and development. The period from birth to age 2 years is especially important for optimal physical, mental, and cognitive growth, health, and development. Stunting (height-for-age), wasting (weight-for-height) and underweight (weight-for-age) are indicators of nutritional status of children. In Lamu County, 29% of children are recorded to have stunted growth, 4% as wasting and 12% as underweight (Figure 5). Lamu County nutrition status rates are about the same as the national rates although stunting rates are slightly higher.
Acute respiratory infection (ARI)

Acute respiratory infection (ARI) is a leading cause of childhood morbidity and mortality across the world. Early diagnosis and treatment with antibiotics can reduce the number of deaths caused by ARI. The ARI rate in Lamu is 9%, which is the same as the national rate.

Fever

Fever is a major symptom of malaria, a life threatening disease, and other acute infections in children. The fever prevalence rate among children under age five in Lamu County is 22% compared to the national rate of 24%. Advice or treatment from a health facility or provider was sought for less than half (45%) of children with fever, which is considerably lower than the national rate (63%).

Prevalence of diarrhoea

Dehydration caused by severe diarrhoea is a major cause of morbidity and mortality among young children. About one in five (17%) children under five years are reported to have diarrhoea in Lamu County, which is about the same as the national rate of 15%. Prompt treatment, including oral rehydration therapy, is important in treating diarrhoea. In Coast region, where Lamu is located, advice or treatment from a health facility or provider was sought for two-thirds (65%) of children with diarrhoea.
